Tactical Throat Microphone

Effective and clear communications are vital in military and covert operations to improve mission effectiveness. Whether engaged in an environment with excessive background noise or whispering co-ordinates to a team-mate, the tactical throat mic is an indispensable accessory to a successful mission.

The throat microphone is specifically designed for situations and environments where boom-mic's are ineffective or cannot be used. By utilizing dual throat microphone transducers, vibrations are absorbed directly from the larynx, hugely reducing environmental and mechanical noise. The vibrations are then converted into recognizable voice frequencies, which can be transmitted. This enables even the quietest whisper in the loudest environment to come through crystal clear.

The Microphone fits comfortably around the neck, and is fully adjustable so able to fit all necks. Each transducer should sit on either side at the base of the throat.

The Tactical throat microphone kit, comes complete with professional grade clear acoustic tube, and flesh coloured surgical ear bud, which fits comfortably inside the ear. This improves clarity of sound, as less background noise is allowed to enter the ear.

The unit incorporates a good sized, strong and robust Push To Talk button that can be attached to clothing via a clip at the back. The PTT button has heavy duty screw connections, that allow for aggressive environments, where only the best quality equipment will do.

The tactical throat microphone is available for Kenwood, Motorola and Standard/Icom radios.
